## BEST AVAILABLE IMAGES

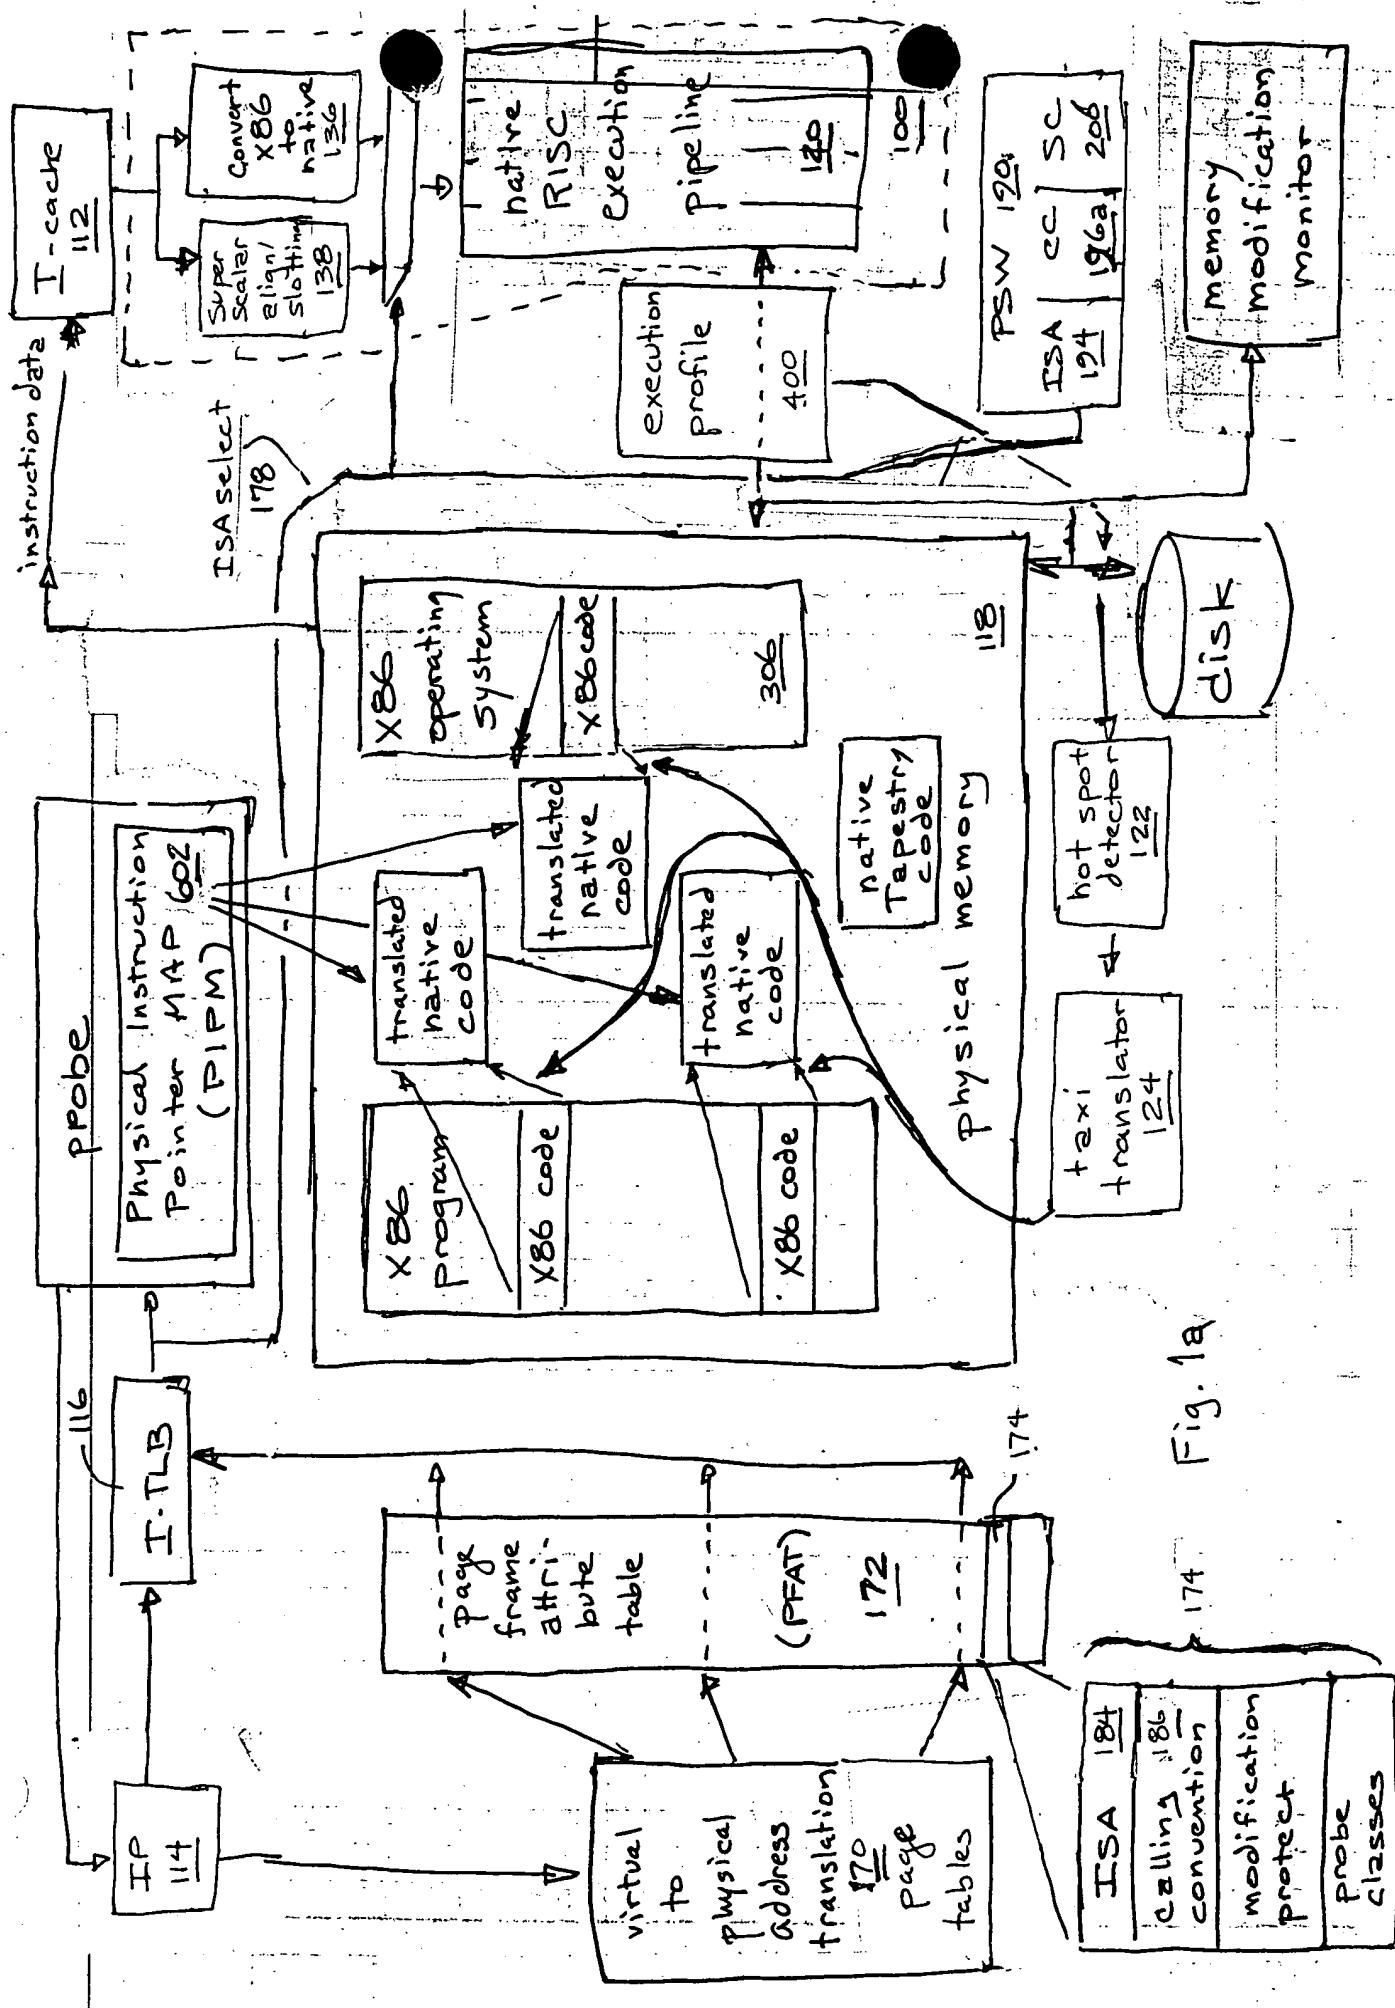

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

**IMAGES ARE BEST AVAILABLE COPY.**

As rescanning documents *will not* correct images,  
please do not report the images to the  
Image Problem Mailbox.

I-TLB property bits	Decoded property values				Interpretation	Instructions sent to:	Collect profile trace-packets?	Probe for translated code	I/O memory reference exceptions
	ISA	CC	200	Protected					
00	Tap	Tap	no	Native code observing native RISCy calling conventions	Native decoder	No	No	Fault if SEG.tio	
01	Tap	x86	no	Native code observing x86 calling conventions	Native decoder	No	No	Fault if SEG.tio	
10	x86	x86	no	x86 code, unprotected - TAX! profile collection only	x86 HW converter	If enabled	No	Trap if profiling	
11	x86	x86	yes	x86 code, protected - TAX! code may be available	x86 HW converter	If enabled	Based on I-TLB probe attributes	Trap if profiling	

Fig. 2a : Significance of the I-TLB property bits

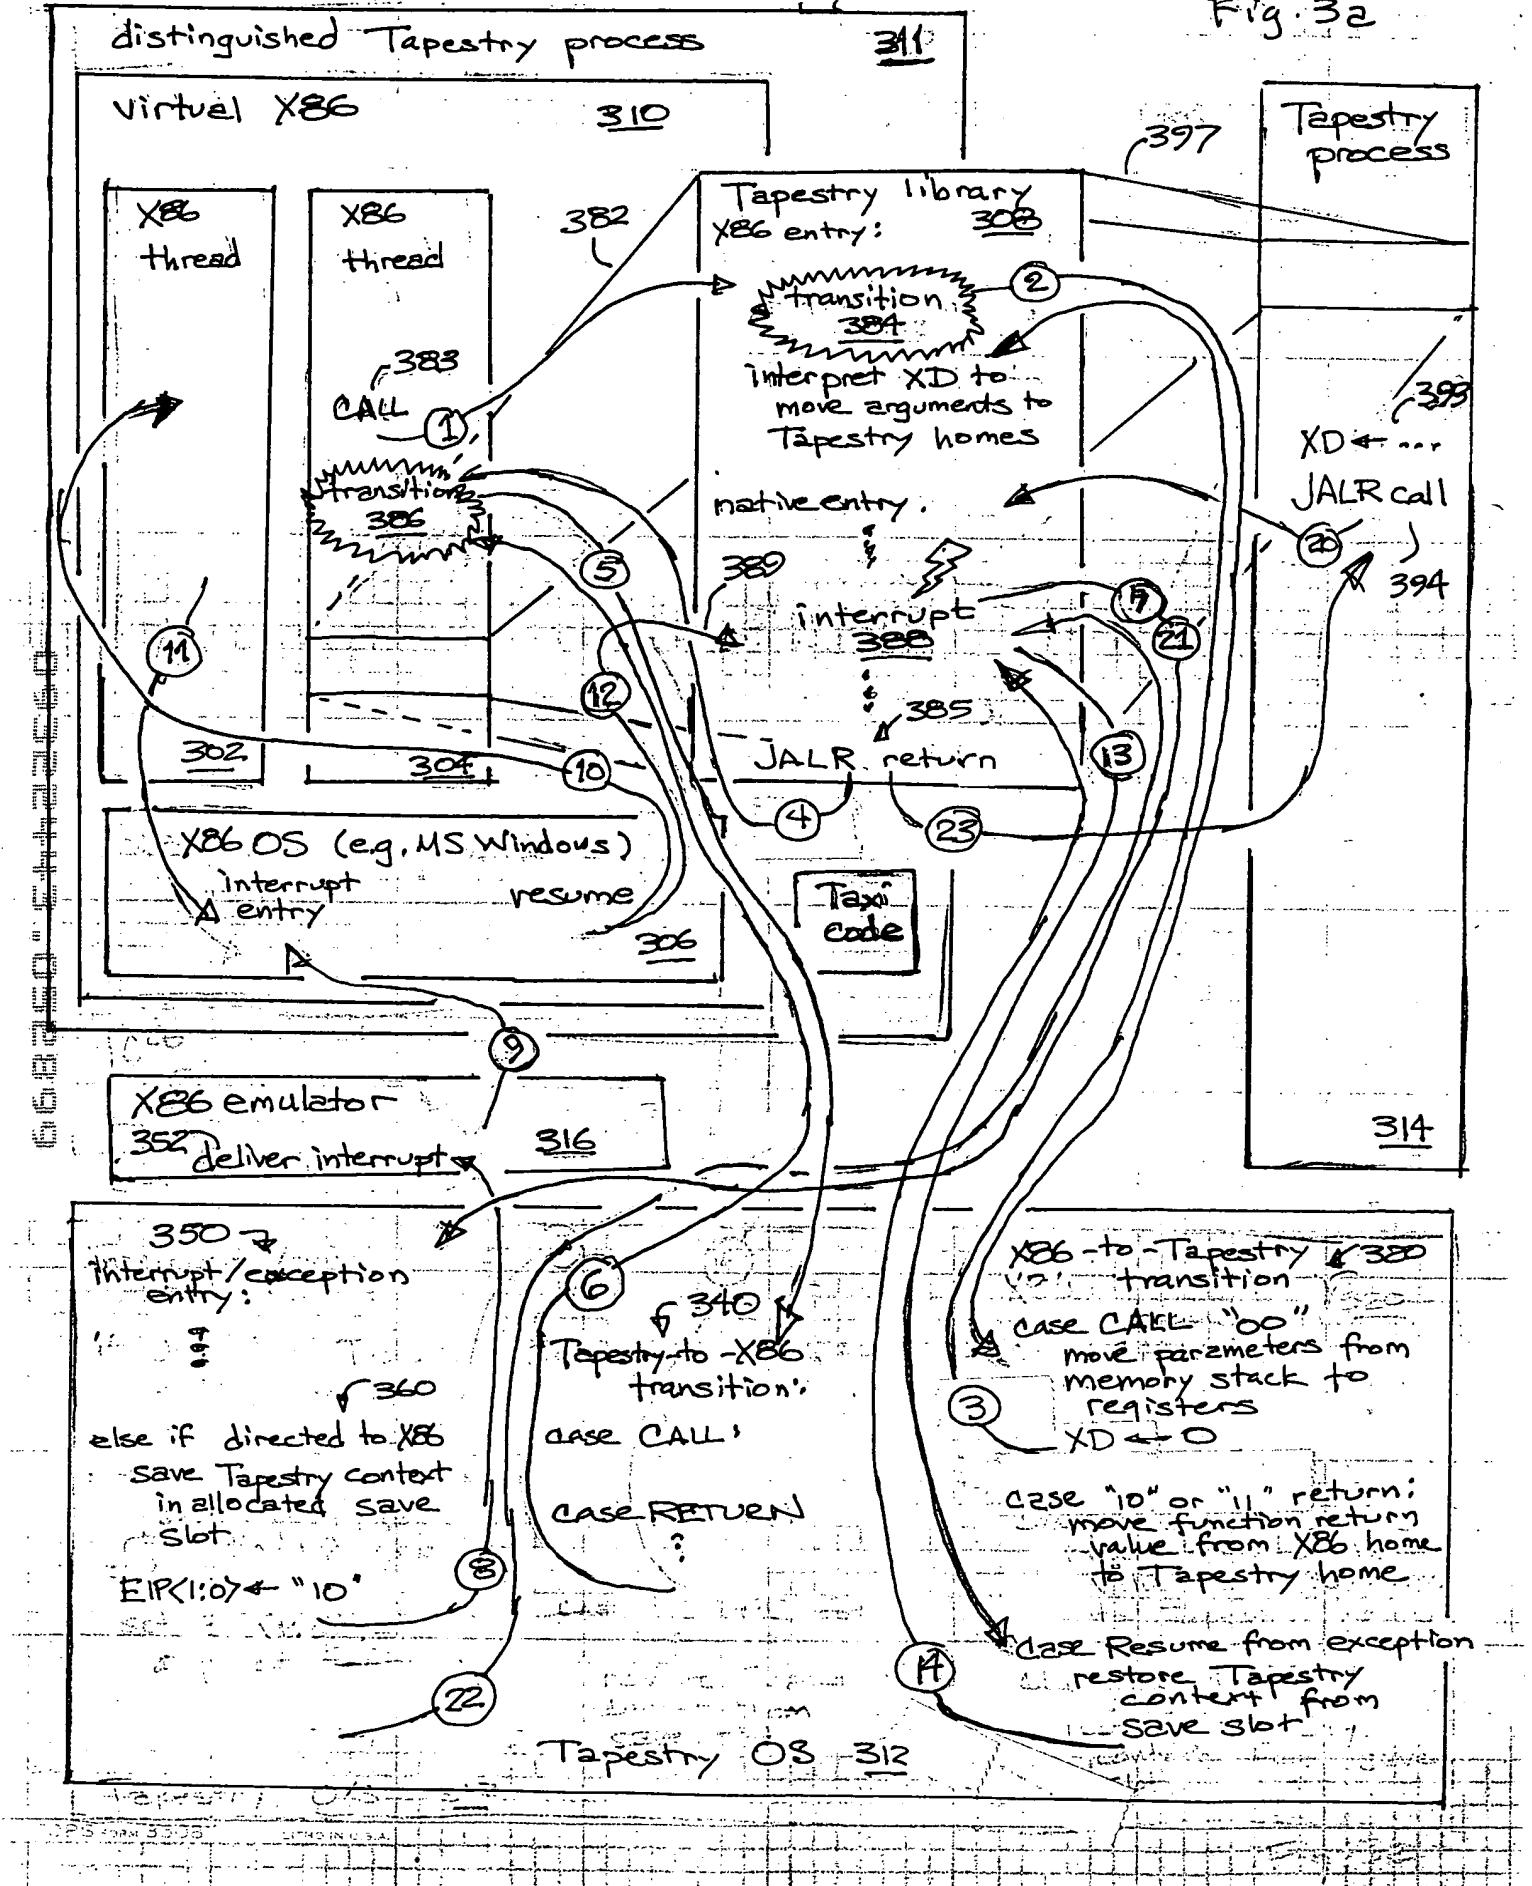

Transition ( source => dest ) ISA & CC property values	Handler Action
00 => 00	No transition exception
00 => 01	VECT_xxx_X86_CC exception - handler converts from native to x86 conventions
00 => 1x	VECT_xxx_X86_CC exception - handler converts from native to x86 conventions, sets up expected emulator and profiling state
01 => 00	VECT_xxx_TAP_CC exception - handler converts from x86 to native conventions
01 => 01	No transition exception
01 => 1x	VECT_X86_ISA exception [conditional based on PCW.X86_ISA_ENABLE flag] - sets up expected emulator and profiling state
1x => 00	VECT_xxx_TAP_CC exception - handler converts from x86 to native conventions
1x => 01	VECT_TAP_ISA exception [conditional based PCW.TAP_ISA_ENABLE flag] - no convention conversion necessary
1x => 10	No transition exception - [profile complete possible, probe possible]
1x => 11	No transition exception - [profile complete possible, probe NOT possible]

Fig. 2b : ISA & CC transition exception flow

	name	description	type
242	VECT_call_X86_CC	push args, return address, set up x86 state	fault on target instruction
244	VECT_jump_X86_CC	set up x86 state	fault on target instruction
246	VECT_ret_no_fp_X86_CC	return value to eax:edx, set up x86 state	fault on target instruction
248	VECT_ret_fp_X86_CC	return value to x86 fp stack, set up x86 state	fault on target instruction
250	VECT_call_TAP_CC	x86 stack args, return address to registers	fault on target instruction
252	VECT_jump_TAP_CC	x86 stack args to registers	fault on target instruction
254	VECT_ret_no_fp_TAP_CC	return value to RV0	fault on target instruction
256	VECT_ret_any_TAP_CC	return type unknown, setup RV0 and RVDP	fault on target instruction

## X86-to-Tapestry transition exception handler

320

// This handler is entered under the following conditions:  
// 1. An x86 caller invokes a native function  
// 2. An x86 function returns to a native caller  
// 3. x86 software returns to or resumes an interrupted native function following  
// an external asynchronous interrupt, a processor exception, or a context switch

321

dispatch on the two least-significant bits of the destination address {  
case "00" // calling a native subprogram

// copy linkage and stack frame information and call parameters from the memory  
// stack to the analogous Tapestry registers

LR ← [SP++] // set up linkage register ~ 323

AP ← SP // address of first argument ~ 324

SP ← SP - 8 // allocate return transfer argument area ~ 326

SP ← SP & (-32) // round the stack pointer down to a 0 mode 32 boundary ~ 327

XD ← 0 // inform callee that caller uses X86 calling conventions ~ 328

322

case "01" // resuming an X86 thread suspended during execution of a native routine

if the redundant copies of the save slot number in EAX and EDX do not match or if  
the redundant copies of the timestamp in EBX:ECX and ESI:EDI do not match {

// some form of bug or thread corruption has been detected

goto TAPESTRY\_CRASH\_SYSTEM( thread-corruption-error-code ) ~ 372

}

save the EBX:ECX timestamp in a 64-bit exception handler temporary register { 373  
(this will not be overwritten during restoration of the full native context)

use save slot number in EAX to locate actual save slot storage ~ 374

restore full entire native context (includes new values for all x86 registers) ~ 375

if save slot's timestamp does not match the saved timestamp { ~ 376

// save slot as been reallocated; save slot exhaustion has been detected

goto TAPESTRY\_CRASH\_SYSTEM( save-slot-overwritten-error-code ) ~ 377

}

free the save slot ~ 378

370

case "10" // returning from X86 callee to native caller, result already in registers

[-SP] ← LR // push LR as return address

### EXIT:

setup emulator context and profiling ring buffer pointer } 348

RFE ~ 349 // to original target

Fig. 3i

## interrupt/exception handler of Tapestry operating system:

350

```
// Control vectors here when a synchronous exception or asynchronous interrupt is to be
// exported to / manifested in an x86 machine.

// The interrupt is directed to something within the virtual X86, and thus there is a possibility
// that the X86 operating system will context switch. So we need to distinguish two cases:
// either the running process has only X86 state that is relevant to save, or
// there is extended state that must be saved and associated with the current machine context
// (e.g., extended state in a Tapestry library call in behalf of a process managed by X86 OS)
if execution was interrupted in the converter – EPC.ISA == X86 {
    // no dependence on extended/native state possible hence no need to save any
    goto EM86_Deliver_Interrupt( interrupt-byte )
} 351

} else if EPC.Taxi_Active {
    // A Taxi translated version of some X86 code was running. Taxi will rollback to an
    // x86 instruction boundary. Then, if the rollback was induced by an asynchronous external
    // interrupt Taxi will deliver the appropriate x86 interrupt. Else, the rollback was induced
    // by a synchronous event so Taxi will resume execution in the converter, retriggering the
    // exception but this time will EPC.ISA == X86
    goto TAXi_Rollback( asynchronous-flag, interrupt-byte )
} 353

} else if EPC.EM86 {
    // The emulator has been interrupted. In theory the emulator is coded to allow for such
    // conditions and permits re-entry during long running routines (e.g. far call through a gate)
    // to deliver external interrupts
    goto EM86_Deliver_Interrupt( interrupt-byte )
} 354

} else {
    // This is the most difficult case – the machine was executing native Tapestry code on
    // behalf of an X86 thread. The X86 operating system may context switch. We must save
    // all native state and be able to locate it again when the x86 thread is resumed.
    361
    allocate a free save slot; if unavailable free the save slot with oldest timestamp and try again
    save the entire native state (both the X86 and the extended state)
    save the X86 EIP in the save slot
    overwrite the two low-order bits of EPC with "01" (will become X86 interrupt EIP) ~ 363
    store the 64-bit timestamp in the save slot, in the X86 EBX:ECX register pair (and,
        for further security, store a redundant copy in the X86 ESI:EDI register pair) 364
    store the a number of the allocated save slot in the X86 EAX register (and, again for
        further security, store a redundant copy in the X86 EDX register) 365
    goto EM86_Deliver_Interrupt( interrupt-byte ) ~ 369
} 360
```

Fig. 3j

```

typedef struct {
    save_slot_t * newer;           // pointer to next-most-recently-allocated save slot } 379c
    save_slot_t * older;           // pointer to next-older save slot
    unsigned int64 epc;            // saved exception PC/IP
    unsigned int64 pcw;            // saved exception PCW (program control word)
    unsigned int64 registers[63];  // save the 63 writeable general registers } 356
    ...                           // other words of Tapestry context
    timestamp_t timestamp;         // timestamp to detect buffer overrun ~ 358
    int save_slot_ID;             // ID number of the save slot ~ 357
    boolean save_slot_is_full;     // full / empty flag ~ 359
} save_slot_t;

```

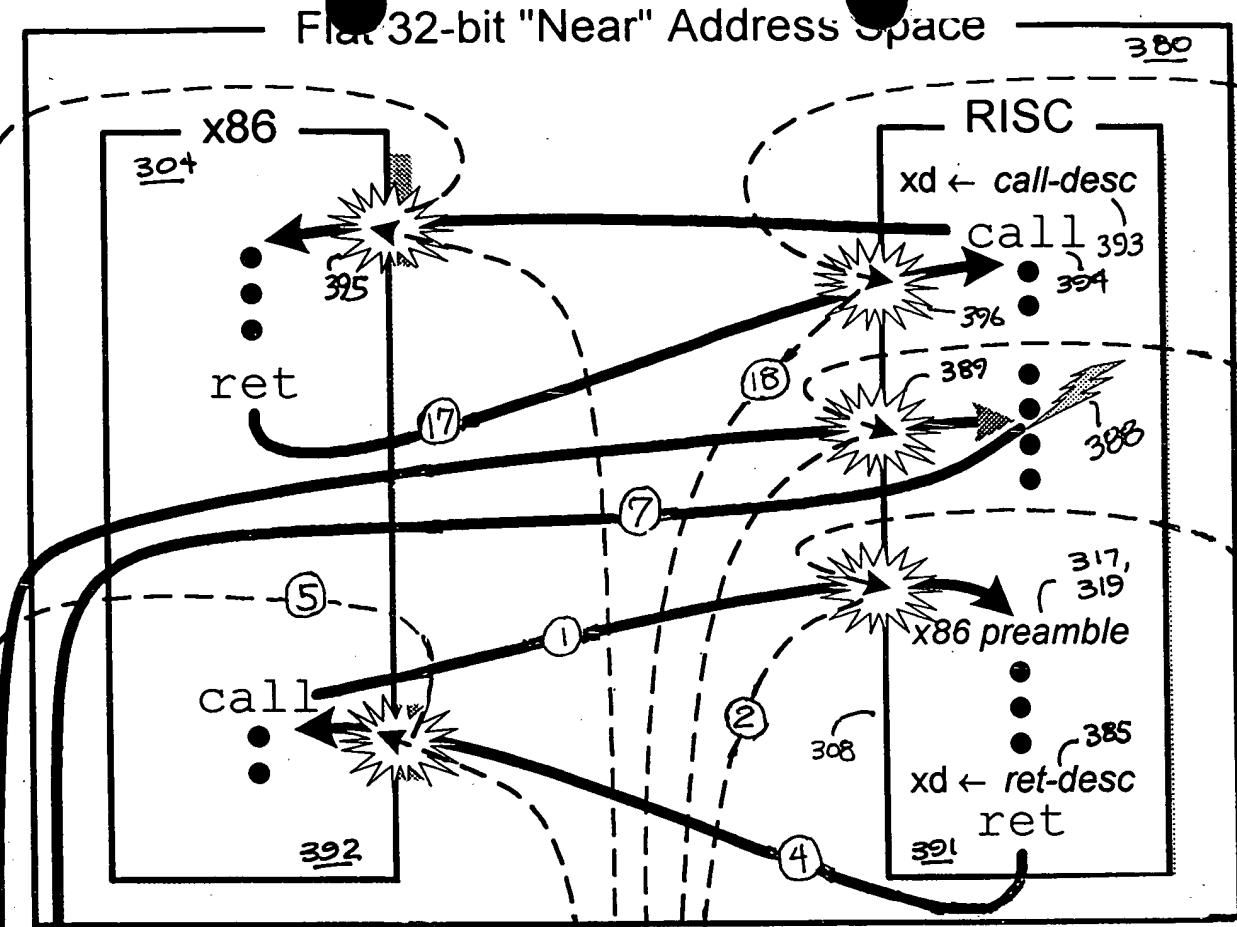

save\_slot\_t \* save\_slot\_head; // pointer to the head of the queue ~ 379a  
 save\_slot\_t \* save\_slot\_tail; // pointer to the tail of the queue ~ 379b

### System initialization

reserve several pages of unpaged memory for save slots

## **taxi profile entry generation**

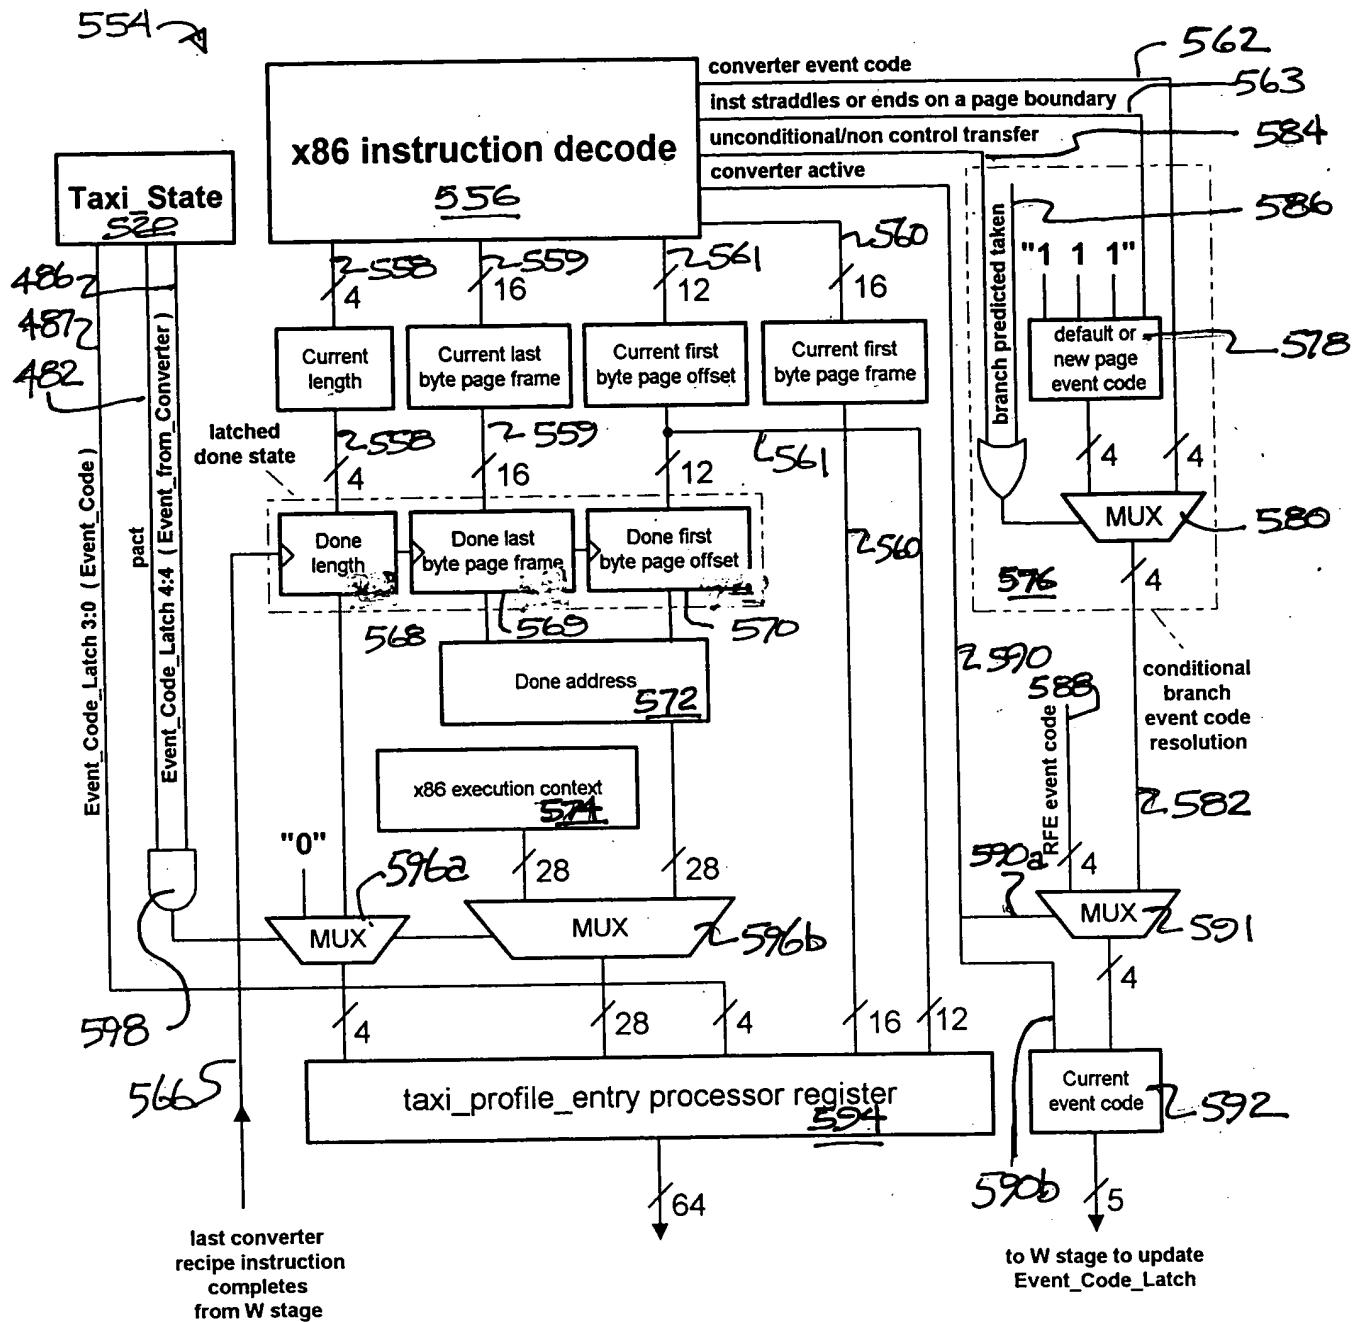

Fig. 5b

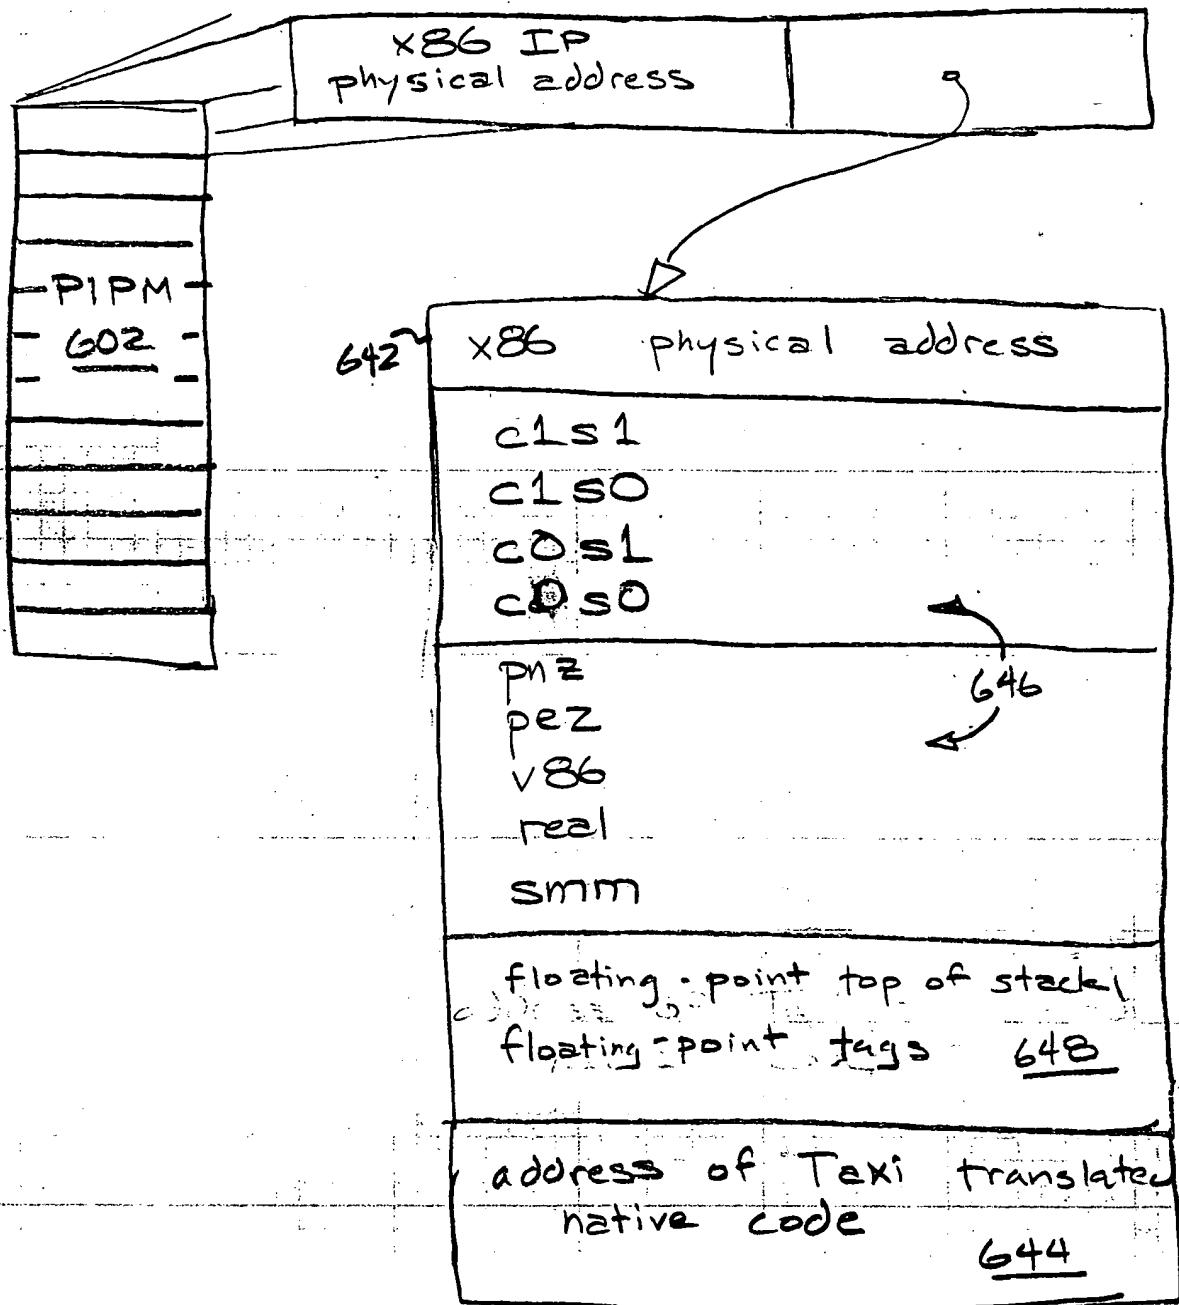

Fig. 6a

Event code from RFE restarting converter  
or mapping of converter's x86 opcode

## RFE or previous convert r cycle

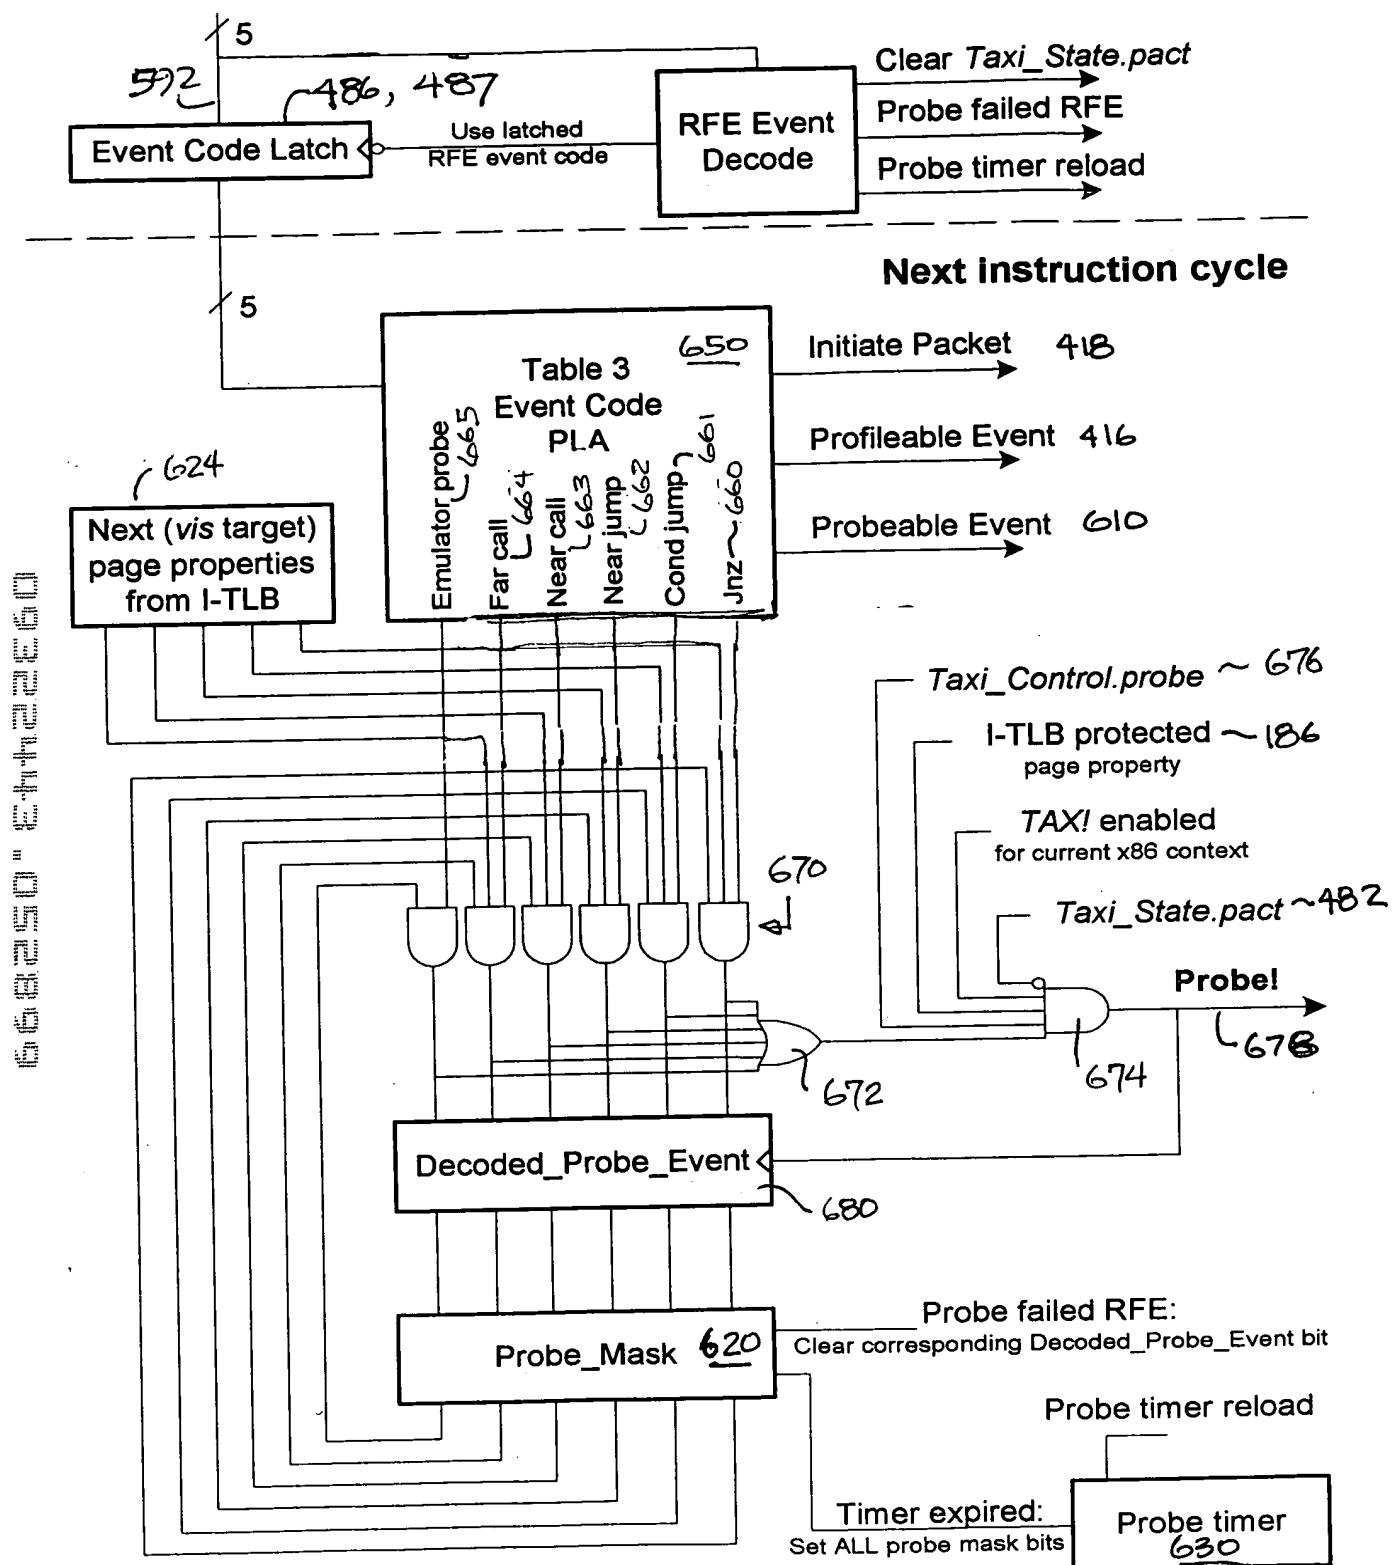

Fig. 6b

As each event occurs during execution of an X86 program in converter 136 or emulator 316, materialize an event code in event code latch 486, 487

650: PLA 650 processes the event code to produce at most one of five classifications of the event, "jnz" 660, "conditional jump" 661, "near jump" 662, "near call" 663, "far call" 664, or "emulator probe" 665

670: The bit 660-665 is ANDed with the probe page properties 624 from TLB 116 and Taxi\_State.Probe\_Mask 620

672: OR together the products of the ANDs. The sum of the OR represents the predicate "the event code 592 is an event on a page whose probeable event bit is currently enabled in Taxi\_State.Probe\_Mask 620 and the TLB copy of the PFAT page properties."

674: AND the sum of the OR together with several machine context predicates to see if this is a probeable event

690: Consult the bit vector to verify that the probeable event is in an address range with a corresponding translated code segment

682: Execute a TAXI instruction to materialize a Context\_At\_Point entry describing the current machine state, to supply arguments to the probe exception handler

Deliver a probe exception to transfer control to the software exception handler

Probe PIPM 602 for an entry 640 corresponding to the address of the target of the event

was a PIPM entry found?

N

mismatch

Evaluate/verify the preconditions from integer portion 686 of PIPM 602 entry 640

match

Evaluate/verify the preconditions from floating-point portion 688 of PIPM 602 entry 640, and if mismatching, unload floating-point context and reload it to conform to PIPM

Transfer control to the TAXI translated native code

Fail: resume execution  
of x86 binary in  
converter 136
